

## Lab 11: GridView Programming

### Objective:

- GridView programming with checkboxes and other controls.

### Lab Tasks:

Use the following table design to create Table in Database.

### Table Design

#### Product Info Table

	Product_ID	int	<input type="checkbox"/>
	Version	nvarchar(50)	<input checked="" type="checkbox"/>
	Description	nvarchar(50)	<input checked="" type="checkbox"/>
	Start_Date	nvarchar(50)	<input checked="" type="checkbox"/>
	End_Date	nvarchar(50)	<input checked="" type="checkbox"/>
	Logo	image	<input checked="" type="checkbox"/>
			<input type="checkbox"/>

### Exercise 1

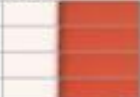

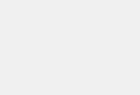

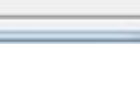

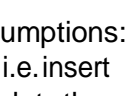

Write a program for the below mentioned product data form having following assumptions:

- All product information are visible in Data grid view.
- Data Grid include checkbox, if user checks certain record it can be deleted or updated.
- If no checkbox is selected, Delete and Update button will remain disabled.
- Select all button selects all the records in grid.
- Delete all button deletes all the records in grid.

**Products Data**

Records : 8

Select All   Delete All   Refresh

				PRODUCT_ID	VERSION	DESCRIPTION	EFFECTIVE_DATE	END_DATE	LOGO
	<input type="checkbox"/>	Delete	Update	1	v1	Food	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	2	v1	Food	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	3	v1	Food	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	4	v1	Food	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	5	v1	Thumb	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	6	v1	Thumb	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	7	v1	Thumb	4/26/2017	4/26/2017	
	<input type="checkbox"/>	Delete	Update	8	v1	Thumb	4/26/2017	4/26/2017	

## Exercise 2

Write a program for the below mentioned product data entry form having following assumptions:

1. INSERT, DELETE and UPDATE buttons will perform according to their desired purpose i.e. insert button will insert data into the datagridview as well as database, delete button will delete the selected row in grid as well as database.

2. Open File dialogue for getting Image path.

```
openFileDialog1.Multiselect = false;
```

```
if (openFileDialog1.ShowDialog() == DialogResult.OK)
```

```
{
```

```
    textBox4.Text = Path.GetFileName(openFileDialog1.FileName);
```

```
}
```

3. Following code converts image into Byte format:

```
public byte[] GetImageData()
```

```
{
```

```
    FileStream fsImageStream = new FileStream(openFileDialog1.FileName, FileMode.Open, FileAccess.Read);
```

```
    byte[] bImageData = new byte[fsImageStream.Length];
```

```
    fsImageStream.Read(bImageData, 0, System.Convert.ToInt32(fsImageStream.Length));
```

```
    fsImageStream.Close();
```

```
    return bImageData;
```

```
}
```

4. Bind Data for getting record from DB and populate into GridView.

```
public void BindData()
```

```
{
```

```

try
{
    DataTable dtData = new System.Data.DataTable();
    using (SqlConnection dbCon = new SqlConnection(@"Data Source=AIS110CL7-045;Initial
Catalog=usman;User ID=sa;Password=bimcs"))
    {
        using (SqlCommand cmdGetData = new SqlCommand("Select * from Product_Info",
dbCon))
        {
            if (dbCon.State == ConnectionState.Closed)
                dbCon.Open();
            using (SqlDataReader drGetData = cmdGetData.ExecuteReader())
            {
                dtData.Load(drGetData);
                for (int iCount = 0; iCount < dtData.Rows.Count; iCount++)
                {
                    DataGridViewRow row = (DataGridViewRow)dataGridView1.Rows[0].Clone();
                    row.Cells[0].Value = dtData.Rows[iCount][0];
                    row.Cells[1].Value = dtData.Rows[iCount][1];
                    row.Cells[2].Value = dtData.Rows[iCount][2];
                    row.Cells[3].Value = dtData.Rows[iCount][3];
                    row.Cells[4].Value = dtData.Rows[iCount][4];
                    byte[] storedImage = (byte[])dtData.Rows[iCount]["Logo"];
                    Image newImage;

                    MemoryStream stream = new MemoryStream(storedImage);
                    newImage = Image.FromStream(stream);
                    row.Cells[5].Value = newImage;
                    dataGridView1.Rows.Add(row);
                    dataGridView1.Rows[iCount].Height = 100;

                }
                if (dataGridView1.Columns[1] is DataGridViewImageColumn)
                {
                    ((DataGridViewImageColumn)dataGridView1.Columns[1]).ImageLayout =
DataGridViewImageCellLayout.Stretch;

                }
                //dgvData.Columns[1].Width = 20;
                //dgvData.Columns[1].Width = 90;
                dataGridView1.AllowUserToAddRows = false;
                dataGridView1.AutoGenerateColumns = false;

            }

        }

    }
}

```

```

    }
    catch (Exception ex)
    {}
}

```

5. Getting Image into Byte format

```
byte[] blImageData = GetImageData();
```

6. Search by have multiple search criteria i.e. by PRODUCT ID, VERSION, START DATE and END DATE.

7. Retrieve Data from Cell Click Event of DataGridView

- `int row;`
- `row = e.RowIndex;`
- `pictureBox1.Image = (Image)dataGridView1.Rows[0].Cells["Logo"].Value;`
- `//..`
- `//..`
- `// Get more row data to Fill desired Controls`

**Data Entry Form**

Product Version:

Description:

Start Date:

End Date:

Search By:

Image:

Path:

Criteria:

	Product_ID	Version	Description	Start_Date	End_Date	Logo
▶	1	v1	abcdef	11/28/2018 1:15...	12/10/2018 1:15...
